

ABSTRACT

A folding knife including an elongate handle and blade. A tang of the blade is pivotally connected to the handle proximate the front end of said handle such that the
5 blade is rotatable about a rotational axis. A pin is positioned on and extends from the tang of the blade. The pin is spaced apart from the rotational axis. The folding knife also includes a bias element housed within the blade cavity. The bias element has a free end. In operation, a portion of the bias element is in continuous urging contact with the pin to assist in the movement of the blade into its opening position.
